

Session 2 Quiz — Cloud Benefits, Pricing Models, and IaaS/PaaS/SaaS

Name: _____ Session: _____

Time: 15 minutes · **Items:** 12 · **Target:** 80%

Answer every question. For *select all that apply*, mark every correct option. For matching questions, write the matching term next to each numeral. For yes/no sets, write yes or no next to each numeral. Your instructor reviews every answer in class immediately afterward.

1. A workload runs continuously and predictably for the next three years on a specific virtual machine size. Which pricing approach is most likely to reduce its cost?

- A. Pay-as-you-go
- B. A reservation
- C. Azure Spot Virtual Machines
- D. The Azure free account

2. A data-processing job can be interrupted and restarted without harm, and the team wants the lowest possible compute price. Which option fits?

- A. A reservation
- B. Azure savings plan for compute
- C. Azure Spot Virtual Machines
- D. Pay-as-you-go

3. Which statement describes Azure savings plan for compute?

- A. You commit to a specific VM size and region for one or three years
- B. You commit to an hourly spend on eligible compute services for one or three years
- C. You pay nothing until you exceed a monthly threshold
- D. You bid on unused capacity and may be evicted

4. Which statement about serverless computing is correct?

- A. There are no servers involved anywhere in the architecture
- B. You must keep at least one instance running to receive events
- C. An event triggers your code, and resources are allocated only around the run
- D. Serverless is a fourth cloud deployment model alongside public, private, and hybrid

5. Which pair correctly matches the scaling type to its action?

- A. Vertical scaling adds more virtual machines; horizontal scaling adds CPU and RAM
- B. Vertical scaling adds CPU and RAM to a resource; horizontal scaling adds or removes resources
- C. Both add resources; only the billing differs
- D. Vertical scaling happens automatically; horizontal scaling is always manual

6. Which best describes reliability as a cloud benefit?

- A. Predicting next quarter's cloud spend accurately
- B. The ability of a system to recover from failures and continue to function
- C. Guaranteeing identical performance in every region
- D. Encrypting data at rest and in transit

7. A team uses autoscaling and load balancing so response times stay steady as traffic changes. Which benefit does this primarily demonstrate?

- A. Cost predictability
- B. Performance predictability
- C. Manageability in the cloud
- D. Governance

8. Which of these are examples of governance and compliance benefits in the cloud? (Select all that apply.)

- A. Deploying from templates so resources meet your technical standards
- B. Cloud-based auditing that flags resources out of compliance with your baseline
- C. Automatic replication of all data to every region by default
- D. Updating resources at scale when standards change

9. Which group of capabilities describes *management of the cloud* rather than *management in the cloud*?

- A. Azure portal, Azure CLI, Azure PowerShell, REST APIs
- B. Autoscaling resources, deploying from templates, automatically replacing failing resources, metric-based alerts
- C. Purchasing subscriptions, assigning licenses, paying invoices
- D. Writing application code, running unit tests, publishing releases

10. (Match each scenario to the cloud service type that fits best: IaaS, PaaS, or SaaS. Each type is used at least once.)

- i. A team lifts and shifts existing servers to the cloud and needs full control of the operating system

- ii. Developers want a managed platform with built-in scalability so they can focus on application code, without handling OS licensing or patching _____
- iii. A finance department subscribes to a ready-to-use expense-tracking application

- iv. A team needs to rapidly create and tear down test environments that replicate an established server configuration _____
- v. An analytics team wants business intelligence tooling delivered as a service so they can mine their own data _____

11. A company subscribes to a cloud-based expense-tracking application. Who is responsible for patching the application, and who is responsible for managing user accounts?

- A. The provider patches the application; the customer manages user accounts
- B. The customer patches the application; the provider manages user accounts
- C. The provider does both
- D. The customer does both

12. Which outcome is a direct consequence of the consumption-based model?

- A. You must forecast capacity a year ahead to avoid penalties
- B. You avoid paying for capacity that sits idle
- C. Compute costs are fixed but storage costs vary
- D. Scaling down requires a support request

Answer sheet

#	Your answer	#	Your answer
1		7	
2		8	
3		9	
4		10	
5		11	
6		12	

Score: ____ / 12

Objectives to review: _____
