

Domain 1 Checkpoint — Describe Cloud Concepts

Name: _____ Session: _____

Time: 15 minutes • **Items:** 12 • **Target:** 75%

Answer every question. For *select all that apply*, mark every correct option. For matching questions, write the matching term next to each numeral. For yes/no sets, write yes or no next to each numeral. Your instructor reviews every answer in class immediately afterward.

1. One credit union still runs virtualized servers it owns in its own building. Another rents compute, storage, and networking over the internet instead of owning them. What makes the second arrangement cloud computing rather than traditional IT?

- A. The workload runs on virtualized hardware
- B. Computing services are delivered over the internet and rented rather than owned
- C. The hardware is newer than five years old
- D. The organization has more than one datacenter

2. A law firm buys everything from virtual machines to a finished email product. Across every one of those purchases, one responsibility never moves to the provider. Which item is always the firm's?

- A. The physical hosts
- B. The operating system
- C. The accounts and identities in the environment
- D. The physical network

3. A team is moving from virtual machines they patch, to a platform that patches the operating system for them, to a finished application they only subscribe to. Which statement correctly describes how responsibility shifts along that path?

- A. IaaS places the most responsibility on the provider, and SaaS the most on the customer
- B. IaaS places the most responsibility on the customer, SaaS the most on the provider, and PaaS sits between them
- C. Responsibility is identical in all three; only pricing differs
- D. The customer is responsible for physical security in IaaS

4. (Match each scenario to the cloud model that fits best: public, private, hybrid, or multicloud.)

- i. A single organization runs a dedicated cloud environment in its own datacenter

- ii. A company keeps regulated data on dedicated infrastructure and runs its public website with a cloud provider, connecting the two _____
- iii. A startup with no hardware buys all of its infrastructure from a cloud provider

- iv. An enterprise runs production workloads with two different public cloud providers and manages security in both _____

5. A news site adds servers for election night and deletes them the next day so it is not paying for idle machines. Which outcome of the consumption-based model is this?

- A. You purchase capacity in advance to guarantee availability
- B. You pay only for resources you use, and you can release them when demand drops
- C. Infrastructure costs become capital expenditure
- D. Costs are fixed and independent of usage

6. A team can commit to a three-year term on a specific virtual machine size for a steady workload. Which pricing option is intended for that situation?

- A. Pay-as-you-go
- B. A reservation
- C. Azure Spot Virtual Machines
- D. The Azure free account

7. A shipping company wants code to run only when a queue message arrives, for a few seconds, and to pay for that run rather than for a server left on. Which description matches what they need?

- A. Code runs on a VM you size and patch yourself
- B. Code is triggered by an event, resources are allocated around the run and released afterward, and you pay for the time it executes
- C. A dedicated physical host is reserved for your workload
- D. A managed desktop is delivered to remote users

8. An application must keep serving users during a datacenter-level failure and must handle a fivefold traffic increase during a sale. Which two cloud benefits are being described?

- A. Governance and compliance
- B. High availability and scalability
- C. Manageability and predictability
- D. Security and reliability

9. A bank comes back online after a datacenter failure, and separately can forecast next quarter's cloud bill from usage. Which statement describes reliability as distinct from predictability in that pair?

- A. Reliability is forecasting cost; predictability is recovering from failure
- B. Reliability is recovering from failure and continuing to function; predictability is being able to anticipate performance and cost
- C. They are two names for the same property
- D. Reliability applies only to storage; predictability only to compute

10. A retailer deploys every new resource from a template so it meets a standard, and gets a flag when a live resource drifts from that standard. Which pair of capabilities are these?

- A. Deploying from templates to meet technical standards, and cloud-based auditing that flags noncompliant resources
- B. Buying hardware in bulk, and negotiating vendor discounts

- C. Writing application code, and running unit tests
- D. Assigning licenses, and paying invoices

11. An operator manages the same environment from a web portal on some days and from a command line or PowerShell on others. Which set of activities describes what they are doing?

- A. Autoscaling resources and automatically replacing failing resources
- B. Deploying from preconfigured templates and receiving metric-based alerts
- C. Using a web portal, a command line interface, APIs, or PowerShell to manage the environment
- D. Monitoring resource health and configuring automatic alerts

12. (Match each requirement to the cloud service type that fits best: IaaS, PaaS, or SaaS.)

- i. Full control of the operating system for a lift-and-shift migration _____
- ii. A ready-to-use email and messaging product with no development work

- iii. A managed development framework with built-in scalability and multitenancy so developers write less infrastructure code _____
- iv. Rapidly created and destroyed test environments replicating an established server configuration

- v. Business intelligence tooling delivered as a service for a team to analyze its own data
