

Session 2 Quiz — Cloud Benefits, Pricing Models, and IaaS/PaaS/SaaS

Name: _____ Session: _____

Time: 15 minutes · **Items:** 12 · **Target:** 80%

Answer every question. For *select all that apply*, mark every correct option. For matching questions, write the matching term next to each numeral. For yes/no sets, write yes or no next to each numeral. Your instructor reviews every answer in class immediately afterward.

1. A workload runs continuously and predictably for the next three years on a specific virtual machine size. Which pricing approach is most likely to reduce its cost?

- A. Pay-as-you-go
- B. A reservation
- C. Azure Spot Virtual Machines
- D. The Azure free account

2. A data-processing job can be interrupted and restarted without harm, and the team wants the lowest possible compute price. Which option fits?

- A. A reservation
- B. Azure savings plan for compute
- C. Azure Spot Virtual Machines
- D. Pay-as-you-go

3. A studio's compute mix changes between virtual machines, containers, and functions, but the hourly spend is steady enough to commit for one year. They do not want to lock a specific virtual machine size. Which statement describes the option that fits?

- A. You commit to a specific VM size and region for one or three years
- B. You commit to an hourly spend on eligible compute services for one or three years
- C. You pay nothing until you exceed a monthly threshold
- D. You bid on unused capacity and may be evicted

4. A photo lab wants a function to run when a customer uploads a picture, and does not want a server sitting idle between uploads. Which statement about that approach is correct?

- A. There are no servers involved anywhere in the architecture
- B. You must keep at least one instance running to receive events
- C. An event triggers your code, and resources are allocated only around the run
- D. Serverless is a fourth cloud deployment model alongside public, private, and hybrid

5. A game studio adds CPU and memory to one server, and on a different system adds and removes whole servers as players come and go. Which pair correctly matches the scaling type to its action?

- A. Vertical scaling adds more virtual machines; horizontal scaling adds CPU and RAM

- B. Vertical scaling adds CPU and RAM to a resource; horizontal scaling adds or removes resources
- C. Both add resources; only the billing differs
- D. Vertical scaling happens automatically; horizontal scaling is always manual

6. A payments company loses a datacenter and the application comes back and keeps working. Which best describes the benefit they just relied on?

- A. Predicting next quarter's cloud spend accurately
- B. The ability of a system to recover from failures and continue to function
- C. Guaranteeing identical performance in every region
- D. Encrypting data at rest and in transit

7. A team uses autoscaling and load balancing so response times stay steady as traffic changes. Which benefit does this primarily demonstrate?

- A. Cost predictability
- B. Performance predictability
- C. Manageability in the cloud
- D. Governance

8. A hospital wants help keeping deployments inside its standards. Which of these are examples of that governance benefit? (Select all that apply.)

- A. Deploying from templates so resources meet your technical standards
- B. Cloud-based auditing that flags resources out of compliance with your baseline
- C. Automatic replication of all data to every region by default
- D. Updating resources at scale when standards change

9. An operations lead wants to scale resources, deploy them from templates, replace failed ones, and alert on metrics. They are not asking which screen or command line to use. Which group describes that work?

- A. Azure portal, Azure CLI, Azure PowerShell, REST APIs
- B. Autoscaling resources, deploying from templates, automatically replacing failing resources, metric-based alerts
- C. Purchasing subscriptions, assigning licenses, paying invoices
- D. Writing application code, running unit tests, publishing releases

10. (Match each scenario to the cloud service type that fits best: IaaS, PaaS, or SaaS. Each type is used at least once.)

- i. A team lifts and shifts existing servers to the cloud and needs full control of the operating system

- ii. Developers want a managed platform with built-in scalability so they can focus on application code, without handling OS licensing or patching _____
- iii. A finance department subscribes to a ready-to-use expense-tracking application

- iv. A team needs to rapidly create and tear down test environments that replicate an established server configuration _____
- v. An analytics team wants business intelligence tooling delivered as a service so they can mine their own data _____

11. A company subscribes to a cloud-based expense-tracking application. Who is responsible for patching the application, and who is responsible for managing user accounts?

- A. The provider patches the application; the customer manages user accounts
- B. The customer patches the application; the provider manages user accounts
- C. The provider does both
- D. The customer does both

12. Which outcome is a direct consequence of the consumption-based model?

- A. You must forecast capacity a year ahead to avoid penalties
- B. You avoid paying for capacity that sits idle
- C. Compute costs are fixed but storage costs vary
- D. Scaling down requires a support request

Answer sheet

#	Your answer	#	Your answer
1		7	
2		8	
3		9	
4		10	
5		11	
6		12	

Score: ____ / 12

Objectives to review: _____
