

Session 7 instructor notes — Identity, Access, and Security

Objectives: 2.4.1–2.4.8 **Slides:** session-07-slides.md **Lab:** ../labs/session-07-lab.md **Quiz:**

../quizzes/session-07-quiz.md — 10 items, 10 minutes **Warm-up:** Session 7 set, weighted to shared responsibility, security and governance benefits, SaaS, and the networking and storage those controls sit on **Domain minutes:** Domain 1 — 10, Domain 2 — 100, Domain 3 — 10

Eight objectives. The plan is deliberate: they are one story (directory, then sign-in, then what you may do, then posture), and the lab hits several at once. Do not add encryption and key management as a scored topic. The module teaches it; the skills measured do not list it. One sentence of context is enough.

Run of show

Min	Block	Leave it when
0–10	Warm-up	
10–35	Directory services	Entra ID, Connect, and Domain Services are three answers
35–60	Authentication, external identities, Conditional Access	MFA is not SSO. B2B collaboration is not External ID for customers
60–80	RBAC, Zero Trust, defense in depth, Defender for Cloud	Reader at subscription scope is understood as inheritance. Defender is not Policy
80–110	Lab	Scope prediction done. Layer sort done
110–120	Quiz	10 minutes, then a short review. If review overflows, cut the demo, not the quiz

Teach A (2.4.1)

Say "Microsoft Entra ID" every time. If someone says Azure AD, translate it once and move on. Gap G6 is the naming trap; do not teach B2C click-paths.

Entra Connect is hybrid sync. Domain Services is a managed domain for workloads that still need domain join or legacy protocols. Neither replaces Entra ID. Entra ID is the directory the others relate to.

Tenant vs subscription: identity boundary vs billing and RBAC boundary. Draw both. People will otherwise hear "tenant" as a synonym for subscription for the rest of the course.

Teach B (2.4.2–2.4.4)

SSO: one sign-in, many apps. MFA: an extra factor. Passwordless: the password is not the thing you type. A user can have SSO and MFA together. They are not alternatives.

External identities, three names only:

- B2B collaboration — guests in your directory.
- B2B direct connect — cross-tenant, Teams shared channels.

- External ID for customers — your app's customers, CIAM. Formerly B2C. Closed to new B2C customers as of May 1, 2025. Do not assign B2C labs.

Conditional Access: signals in, decision out. Example: if the user is an owner and the location is unfamiliar, require MFA. It does not replace RBAC. A blocked sign-in never gets to the role check.

Teach C (2.4.5–2.4.8)

RBAC sentence: security principal + role + scope. Inheritance down the hierarchy from Session 3. Worked example you will reuse in the lab: Reader on the subscription means Reader on every resource group in it. Contributor does not grant role assignments. Owner does.

Zero Trust, the three principles, verbatim enough to recall: verify explicitly, least privilege, assume breach. Tie least privilege to RBAC scope in one sentence.

Defense in depth: seven layers on the slide. The lab places controls. Do not invent an eighth.

Defender for Cloud: secure score and recommendations. Distinguish it from Azure Policy (Session 9) now, or Session 9 will be muddy: Policy evaluates resource configuration against a rule you assign; Defender for Cloud recommends security improvements and scores posture.

Encryption: context only. "Azure can encrypt data at rest and in transit; key services exist; not an objective we quiz." Then stop.

Lab

The guided project is the right at-home follow-through. In class, prioritize the paper scope prediction and the layer sort. Those two do not depend on a tenant where guests and role assignments are allowed. Many learner tenants cannot create Conditional Access policies (licensing). Read templates, do not require a saved policy.

If you are short on time

Cut the Defender portal tour before you cut the RBAC inheritance example. Cut B2B direct connect detail before you cut the three-way external-identity distinction. The quiz is already short. Do not shorten it further.
