

Session 9 instructor notes — Governance and Compliance

Objectives: 3.2.1, 3.2.2, 3.2.3 **Also practiced:** 3.1.4 (tags, inside the project) **Slides:** session-09-slides.md **Lab:** ../labs/session-09-lab.md **Quiz:** ../quizzes/session-09-quiz.md **Warm-up:** Session 9 set, weighted to hierarchy, RBAC scope, tags, and the security-and-governance benefit **Domain minutes:** Domain 1 — 5, Domain 2 — 5, Domain 3 — 110

Run of show

Min	Block	Leave it when
0–10	Warm-up	Inheritance and "Reader does not restart a VM" are available
10–35	Policy	Audit vs deny, and Policy vs RBAC, in their own words
35–60	Locks and Purview	CanNotDelete vs ReadOnly. Purview scoped to data governance, not a tour
60–90	Lab	Triage done. Lock failure seen, or the no-cost read done
90–105	Quiz	
105–120	Wrap	The five-tool table reconstructed from the room, not from the slide

Teach A

Policy definition, initiative, assignment, scope, compliance state. Keep the verbs. An initiative is a bundle of definitions so you assign one thing. Compliance state is what you read afterward: compliant or not.

Audit vs deny is the exam contrast. Audit is visibility. Deny is prevention. There are other effects (modify, append). Name them only if the module you re-read this week still lists them, and do not quiz beyond audit and deny unless the quiz file already does.

Worked example: a policy denies virtual machines outside two regions. A Contributor's RBAC still says they may create a VM. The create fails because the resource shape is illegal. Write both sentences on the board.

Teach B

Locks. Portal says Delete. API and some CLI say `CanNotDelete`. Teach both words or the lab output will look like a different feature.

Read-only means no writes. A lock on a resource group applies to resources in it. Inheritance again.

Why locks exist: RBAC's Owner can delete. A lock is the guardrail against a tired Owner. Removing the lock is a separate permission decision. Do not imply a lock survives an owner who is determined and allowed to remove locks. It survives the delete call, not a governance bypass.

Purview, gap G7. Purpose: data governance and compliance — discover and classify data, support requirements. Out of scope: walking the Purview portal, Microsoft Fabric, or a product catalog. If the module name has shifted, teach the purpose the study guide states and say the portal may have been

reorganized.

Service Trust Portal: context, one minute, "Microsoft's paperwork about Microsoft," not your resource compliance.

Lab

The failure to delete is the moment that makes locks real. Rehearse it. If the room has no subscription, the no-cost path reads a built-in policy definition and does the triage on paper. Do not spend 20 minutes on permission errors.

Guided project: [Organize and protect resources with tags and locks](#).

Wrap

Make them rebuild the five-row table with books closed. Policy vs RBAC vs locks is the predictable confusion named in the six-week plan. Management-group assignment vs subscription assignment is the second one: broader scope, more inheritance, same tools.

If you are short on time

Cut the Service Trust Portal. Cut Purview to the purpose sentence plus "not Policy." Do not cut audit vs deny or the lock demo.
